CHEMICAL SECURITY & DRONES

Government statistics show that personal and commercial use of drones in the United States is growing at a rapid rate. In fact, there are currently more drones registered with the Federal Aviation Administration (FAA) than piloted aircrafts. Each day there are new examples that highlight how ill-equipped our country's laws are when it comes to grappling with the new safety and security challenges that have accompanied the increased use of drones.

DRONES ARE BECOMING AN INCREASINGLY VALUABLE TOOL FOR MANUFACTURERS IN A VARIETY OF APPLICATIONS:

Enhanced Inspections

Increased Surveillance

Emergency Response

POLICY PRIORITIES

We strongly urge FAA to adopt rules that prevent the use of drones to:

Cause intentional and unintentional harm to people and/or damage to a chemical plant.

Conduct unauthorized surveillance of facility operations and personnel, storage locations and movement of chemicals.
